Cross-Domain Analysis of 30 Fields

Integrated Findings from Structural Similarity Exploration

This deck summarizes the common structure of the five-stage model found across 30 fields, from mathematics to traditional knowledge.

Phase 8 Five-Theme Integrated Structure Diagram

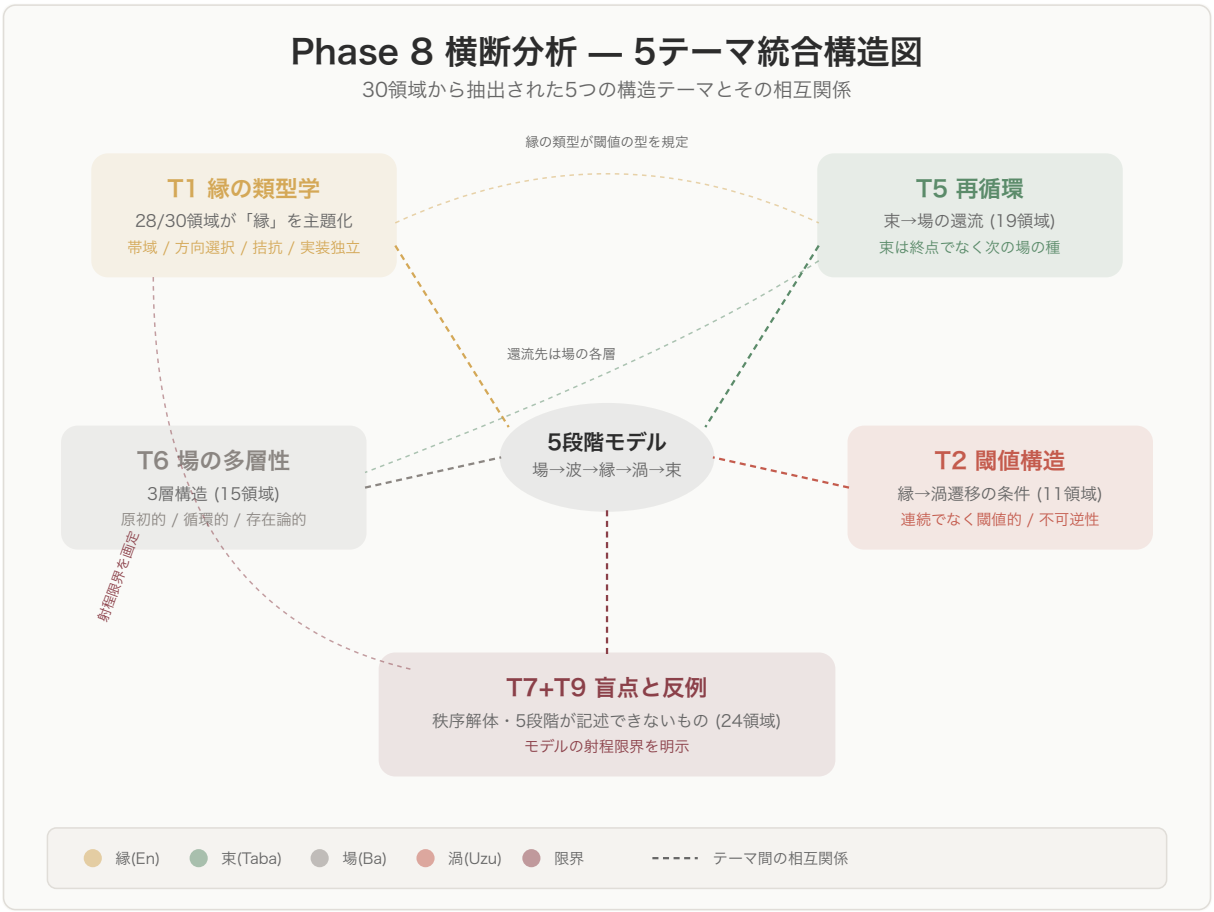

Figure 1: Phase 8 Five-Theme Integrated Structure Diagram

Stage-Level Distribution

Scale of Investigation

- **Fields covered**: 30 academic fields (D01-D30)
- **Patterns extracted**: 150 total (5 per field)
- **Cross-cutting themes**: 5
- **Maximum convergence**: 28/30 fields converged on a single theme
- **Position**: Integrated summary of Phases 1-8

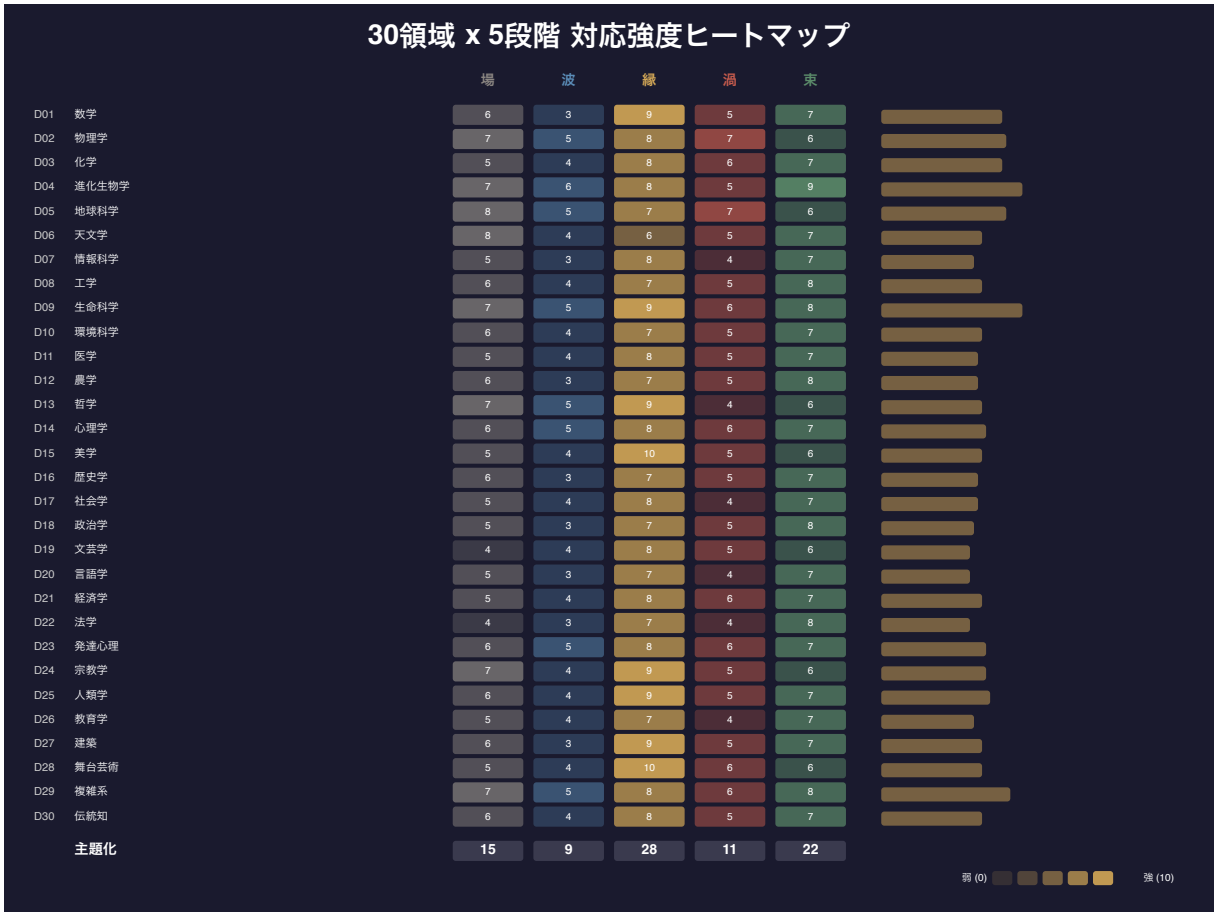

Figure 2: 30 Domains x 5 Stages Correspondence Heatmap

Distribution by Stage

- **En**: 28 fields. The most frequent. Polymorphic concept family
- **Taba**: 22 fields. Circulation and dynamism concentrated here
- **Ba**: 15 fields. Multi-layered, conditioned potentiality
- **Uzu**: 11 fields. Bidirectionality of creative/destructive emergence
- **Nami**: 9 fields. The least theorized stage

Conclusion: En is the core; Nami remains the largest open territory.

Theme 1: Typology of En

- **Support**: 28/30 fields
- **Claim**: En is not one concept but a concept family
- **Representative types**: Mathematics: boundary condensation Physics / Earth science: phase transition Architecture: zone design Performing arts: operational definition Religious studies: passivity inversion

Core insight: En is not a static boundary but a dynamic process of simultaneous selection and generation.

Theme 2: Threshold Structure

- **Support**: 11 fields
- **Claim**: En-to-Uzu transition has discontinuous conditions
- **Representative forms**: Quantitative: physics, astronomy Controllable: chemistry Probabilistic: complexity science Developmental: religious studies, developmental psychology
- **Key point**: 10 fields describe "Uzu-unreached pathways"

Core insight: Not every En reaches Uzu.

Theme 3: Recirculation Mechanisms

- **Support**: 19 fields
- **Claim**: Taba is not an endpoint but the seed of the next Ba
- **Representative modes**: natural return active return dramatic return unstable Taba branching Taba

Core insight: Taba-to-Ba is not return to the same field, but an irreversible spiral.

Theme 4: Multi-layered Ba

- **Support**: 15 fields
- **Claim**: Ba is not "nothingness" but structured potentiality
- **Two types**: primordial Ba: structure does not yet exist cyclical Ba: conditioned state produced by prior Taba
- **Representative fields**: astronomy, earth science, evolutionary biology

Core insight: Ba is not a passive precondition but an active structure that shapes what follows.

Theme 5: Blind Spots and Counterexamples

- **Raised by**: 13 fields
- **Blind spots**: treatment of order dissolution resistance to staging implicit assumptions: temporality, consciousness, energy supply
- **Representative case**: mass extinction in earth science as destructive Uzu

Core insight: The five-stage model describes order generation, not every kind of change.

Five-Theme Structural Network

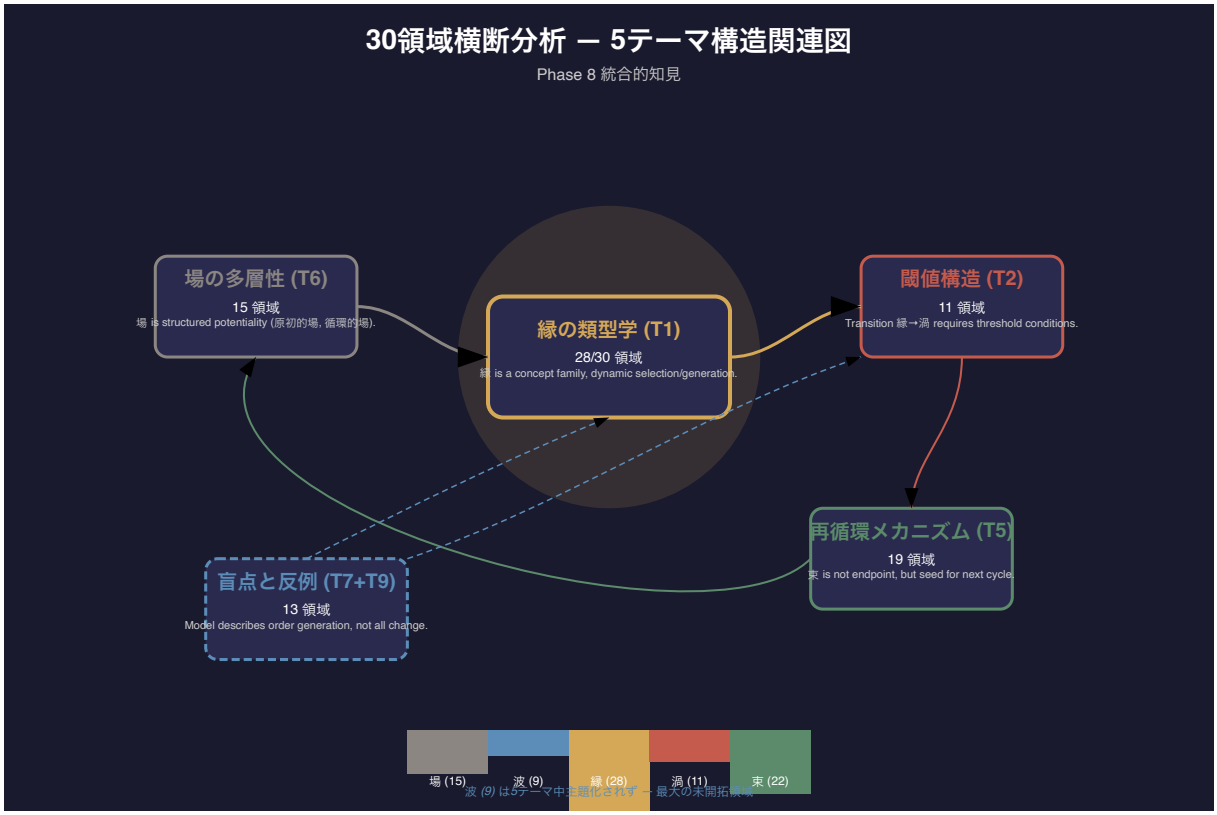

Figure 3: 5-Theme Structural Relationship Diagram

How the Five Themes Connect

- Multi-layered Ba: defines the starting condition
- Typology of En: describes the form of the contact zone
- Threshold Structure: specifies conditions for En-to-Uzu transition
- Recirculation Mechanisms: explains how Taba returns as the next Ba
- Blind Spots / Counterexamples: mark limits and failure paths

Reading rule: The five themes are not separate topics but coordinated descriptions of Ba -> En -> Uzu -> Taba -> Ba.

Proposals for Stage Definitions

- **Ba**: distinguish primordial Ba and cyclical Ba
- **En**: expand from one definition to a concept family
- **Uzu**: introduce bidirectionality of creative and destructive Uzu
- **Taba**: redefine as the seed of spiral recirculation, not a terminal endpoint

Most robust update: the cyclical nature of Taba.

Recurring Holding Points

- the definition problem of Ba
- integrated typology of En
- refinement of Uzu
- dynamism of Taba
- analytical generation vs. existential generation
- Nami as an independent stage
- systematization of failure modes

Implication: cross-domain comparison is advanced, but theoretical consolidation is still ongoing.

Candidate Next Phases

- independent theorization of Nami
- refinement of the consciousness-involvement spectrum
- expansion of non-Western theories
- systematization of failure modes
- external expert review

Decision point: revisions to stage definitions remain under pjdhiro's judgment.

Scope of the Model

- **Can do**: compare whether theories from different fields point to the same structure
- **Cannot do**: explain every change or every process of dissolution
- **Strength**: provides a shared coordinate system for cross-domain comparison
- **Weakness**: Nami, failure modes, and non-Western perspectives remain underdeveloped

Position: not a total theory, but a structural lens for comparison.

Summary

- **Universality of En**: 28/30 fields describe its polymorphism
- **Robustness of recirculation**: 15+ fields support the Taba-to-Ba spiral
- **Redefinition of Ba**: Ba is conditioned potentiality, not nothingness
- **Honest limits**: blind spots and counterexamples are explicit

Cross-domain analysis across 30 fields shows that the five-stage model is a plausible **shared structural candidate** across otherwise different domain theories.
