Philosophy

Structural correspondence survey with the five-stage model (Ba, Nami, En, Uzu, Taba)

Survey Overview

- **Scope**: 11 major theories in philosophy
- **Research question**: Do theories in philosophy structurally correspond to the five-stage model?
- **Results**: Strong correspondence 5, Partial correspondence 5, Conditional correspondence 1

Overview of the Five-Stage Model

Stage	Definition
Ba (Field)	An undifferentiated state. Initial conditions where neither direction nor structure has yet been determined
Nami (Wave)	A stage of exploration where multiple directions diverge and compete
En (Edge)	A state of tension where opposing elements coexist without converging to either side. A place where elements meet at boundaries, influence each other, and relationships emerge
Uzu (Vortex)	A stage where new coherence (order) spontaneously arises from within tension
Taba (Bundle)	A stage where form is established and stabilizes as a reusable structure

---

Overall Structural Correspondence

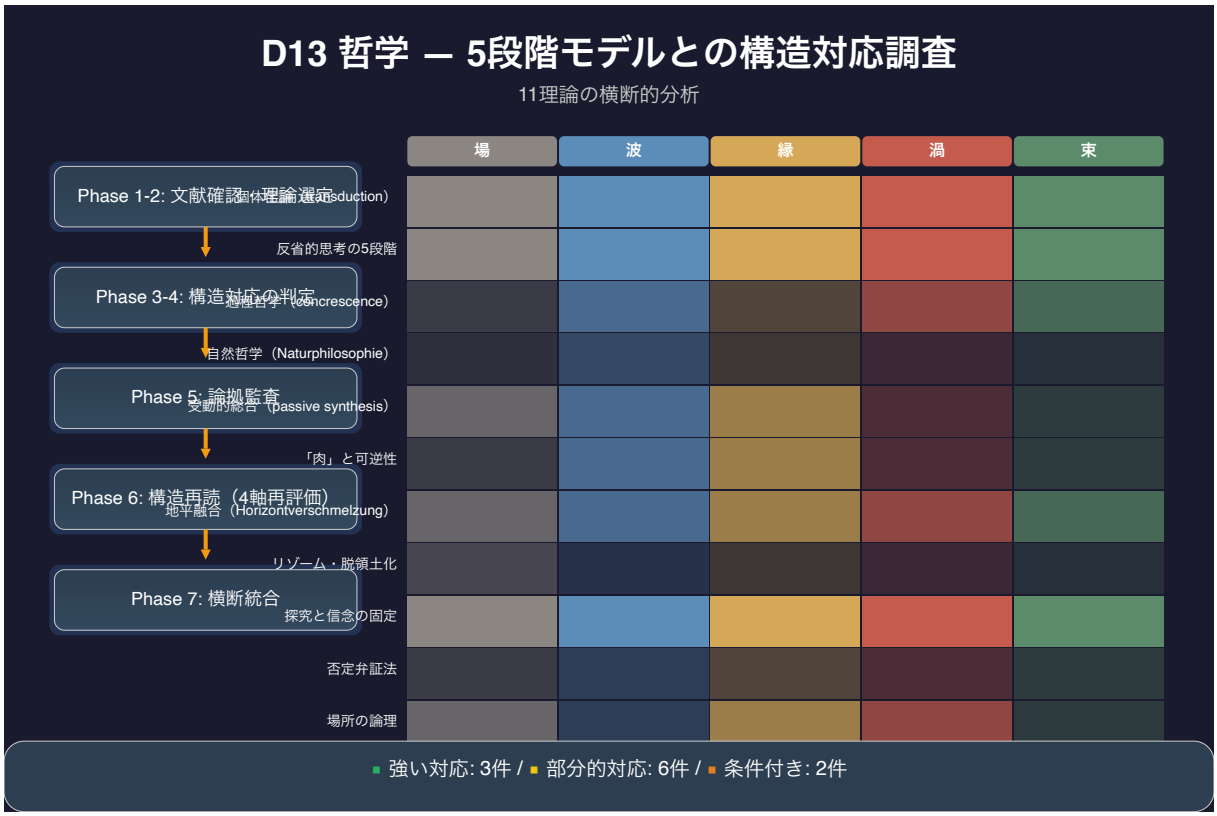

Figure 1: Domain — Research Overview Infographic

Temperature	Theory group	Assessment
—	———-	———
1	Individuation theory (transduction)	Simondon
2	Five stages of reflective thought	Dewey
3	Process philosophy (concrescence)	Whitehead
4	Philosophy of nature (Naturphilosophie)	Schelling
5	Passive synthesis	Husserl
6	“Flesh” and reversibility	Merleau-Ponty
7	Fusion of horizons (Horizontverschmelzung)	Gadamer
8	Rhizome and deterritorialization	Deleuze-Guattari
9	Inquiry and fixation of belief	Peirce
10	Negative dialectics	Adorno
11	Logic of place	Nishida Kitaro

Key Entry 1: Simondon’s Theory of Individuation

- Simondon was a French philosopher who directly reexamined the question of “how does what exists come to be?” Traditional philosophy had conceived of individuals as arising from the encounter of matter and form (hylomorphism). Simondon rejected this premise and argued that the individual is described as a continuous process of generation through transduction from a pre-individual metastable field (*L’individuation*, Introduction, §I).
- Transduction is the operation by which local structural resolution propagates to adjacent regions. The paradigmatic case is the process by which a seed crystal in crystallization successively induces structuring in adjacent supersaturated solution. Even more important is the point that pre-individual surplus is not exhausted by individuation. Even after individuation is complete, the possibility of re-individuation is retained (ibid., §I.2).

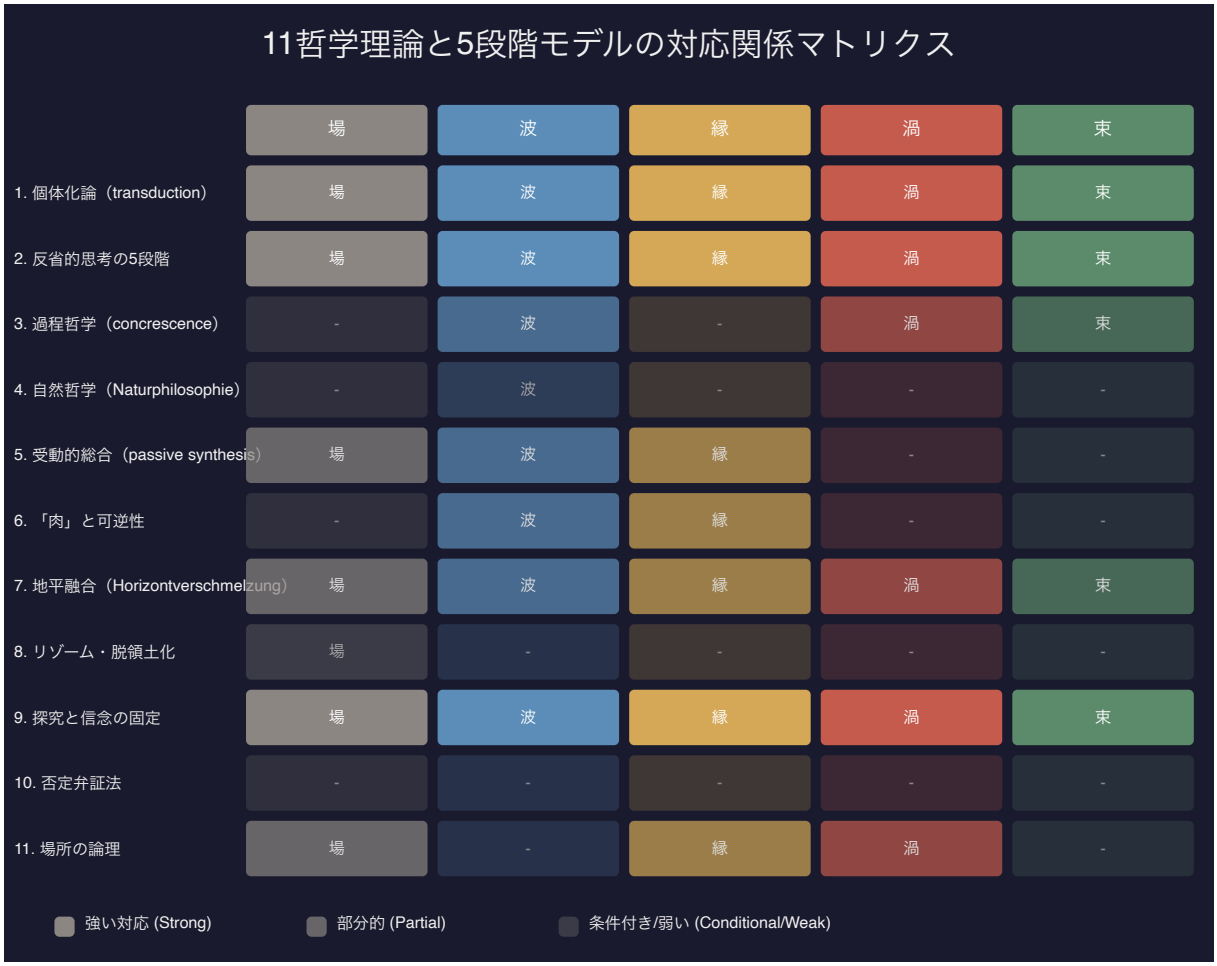

Figure 2: Domain — Theory x 5-Stage Correspondence Matrix

- **As fact**: Simondon describes the process of individuation as a series of phases: a pre-individual metastable state, destabilization through a potential difference, propagation of local structuring through transduction to adjacent regions, the simultaneous generation of the individual and its environment, and a stable structure that retains pre-individual surplus. The individual is generated simultaneously with the environment (milieu), and the two are inseparable.
- **As reading**: Here we note the breadth of scope in describing the entire generation of existence as a single process. The level of similarity is structure. Simondon's description targets the same problem domain as the five-stage model — the creation of existence itself — and the correspondence is not a partial match of concepts but a correspondence of the structure of the process as a whole. In particular, transduction's structure of "local resolution propagating to adjacent regions" can be read not merely as label similarity but as an operational principle that connects multiple elements as a chain of relationships.
- **As interpretation**: The pre-individual metastable state corresponds to Ba; destabilization through a potential difference corresponds to Nami; the propagation of local structuring through transduction to adjacent regions corresponds to En; the simultaneous generation of the individual and its environment corresponds to Uzu; and the stable structure retaining pre-individual surplus corresponds to Taba. Furthermore, the point that pre-individual surplus is not exhausted constitutes an ontological answer to the question of why the process from Taba back to Ba — that is, why the process never ends. This correspondence does not arise from an accidental coincidence of stage counts but from the fact that both theories describe the same problem domain of "the generation of existence" in different vocabulary systems.

Key Entry 2: Dewey's Reflective Thought

- Dewey is a philosopher representative of American pragmatism, widely known also for his philosophy of education and theory of democracy. In *How We Think* (1910, Chapter 6), he explicitly enumerated "five logically distinct steps" of reflective thought: (i) a felt difficulty, (ii) its location and definition, (iii) suggestion of a possible solution, (iv) development of the suggestion by reasoning, and (v) further observation and experiment leading to acceptance or rejection.
- Dewey himself attached an important caveat: these steps are not in a rigid linear order and may overlap with one another. He noted that "uneasiness or shock may come first, with the problem becoming clarified only later" (ibid., ch.6, p.72).
- **As fact**: In *Logic: The Theory of Inquiry* (1938, ch.6), he formulated inquiry more generally as "the controlled or directed transformation of an indeterminate situation into one that is so determinate in its constituent distinctions and relations as to convert the elements of the original situation into a unified whole." The starting point of inquiry is a "feeling of something amiss" — a pre-reflective qualitative experience that precedes conceptual formulation. Furthermore, in Dewey's pragmatism, inquiry does not merely recognize the situation but transforms it.
- **As reading**: Here we note that Dewey explicitly enumerated the process of reflective thought as five stages in the primary literature, and that it is formulated as a transformation from "indeterminate to determinate." The level of similarity is process. In particular, "the location and definition of the difficulty" — the operation of identifying relationships among elements and formulating a question — is structurally characterized as a relational operation.
- **As interpretation**: The indeterminate situation corresponds to Ba; the felt difficulty corresponds to Nami; the location and definition of the difficulty corresponds to En; the suggestion of a possible solution through to development by reasoning corresponds to Uzu; and acceptance or rejection through further observation and experiment corresponds to Taba. This correspondence has the lowest arbitrariness in mapping among all 30 domains because Dewey himself enumerated five stages. However, it should be noted that Dewey's five stages are a description of "reflective thought," and views may differ on extension to "the creation of existence in general." Dewey himself, from a pragmatist standpoint, rejected the separation of cognition and action, and separately discussed the relationship between artistic creation and problem-solving reflection in *Art as Experience* (1934).

Key Entry 3: Merleau-Ponty's "Flesh" and Reversibility

- Merleau-Ponty was a French philosopher who extended Husserl's phenomenology into a theory of the body. In his posthumous work *Le visible et l'invisible* (1964), he introduced the concept of "flesh" (chair). Flesh is neither matter nor spirit but a pre-differential "element" shared by subject and world. "The flesh is not matter, is not mind, is not substance. To designate it, we should need the old term 'element,' in the sense it was used to speak of water, air, earth, and fire," Merleau-Ponty wrote (VI, p.184).
- **As fact**: Merleau-Ponty calls the minimal difference within flesh "dehiscence" (ecart). He also described "reversibility" (reversibilite) — the touching hand is also touched — and the "chiasm" (chiasme), where the visible and the invisible intersect. Reversibility is not perfect coincidence; it always contains dehiscence — a slight divergence (VI, pp.179, 194-195). The body is neither a pure subject nor a pure object but the site of intentional projection toward the world as "a third mode of being."
- **As reading**: Here we note the structure in which, from a shared medium prior to the separation of subject and world, reversible mutual transformation arises through the trigger of a minimal difference. The level of similarity is structure, and in particular, "mutual transformation at a boundary" depicted by reversibility/chiasm can be read not as unidirectional causality but as the establishment of bidirectional relationship.
- **As interpretation**: Flesh corresponds to Ba — as a pre-differential element prior to the separation of subject and world. Dehiscence corresponds to Nami — initiating differentiation as the minimal difference within flesh. Reversibility and the chiasm correspond to En. The interface where the touching and the touched intersect is one of the most profound philosophical descriptions of En in the five stages. The body's creative formative capacity (expression) corresponds to Uzu; the sedimented cultural world corresponds to Taba; and the cycle is completed as cultural sedimentation becomes the horizon (Ba) of the next perception.

Cross-Cutting Patterns

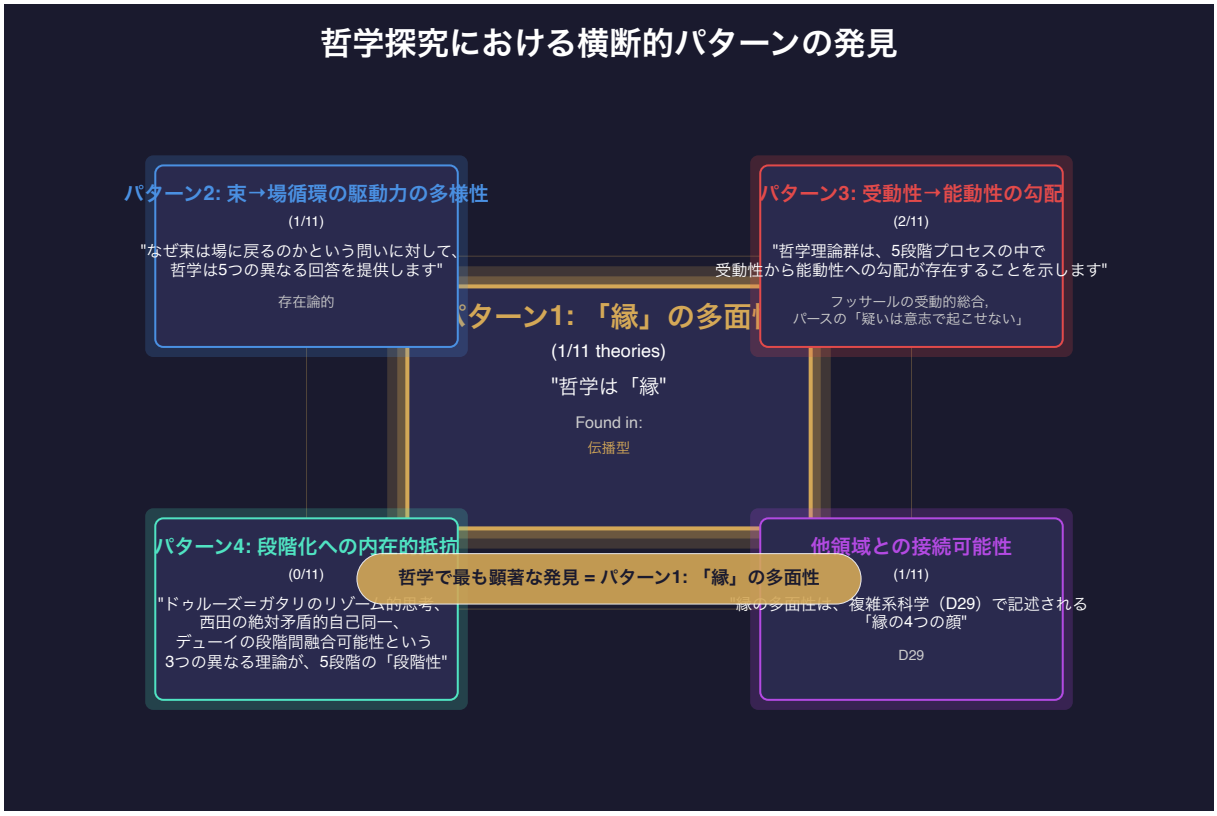

Figure 3: Domain — Cross-Cutting Patterns Diagram

- The most striking pattern across philosophy is the philosophical diversity of "En"
- **Transduction (Simondon)**: A chain of relationships in which local structuring propagates to adjacent regions. En as "dynamics."
- **Problem formulation (Dewey)**: The operation of identifying relationships among elements of a felt difficulty. En as "problematization."
- **Abduction (Peirce)**: The operation of creatively leaping to generate a hypothesis from a surprising fact. En as "creative leap."

Unresolved Questions

- At which level the five-stage "Ba" is located — experiential (Husserlian), ontological (Simondonian), or ultimate (Nishidian) — has not yet been settled. Nishida's "place of absolute nothingness" may exceed the scope of the five-stage Ba, and examination of whether Ba has a hierarchy of depth is needed.
- Deleuze-Guattari's rhizomatic thinking principally rejects linear stage models. If the five-stage model is understood not as "linear stages" but as a "spectrum," this criticism may be mitigated, but this tension has not been resolved.
- Schelling's philosophy of nature powerfully describes "Nami" (polarity) but lacks an intermediate term corresponding to "En." This suggests that the transition from binary opposition (polarity) to multiple relationships (En) is a non-trivial requirement of the five-stage model, but the validity of this structural requirement needs to be verified against findings from other domains.
- The distinction between analytic generation (the generation of understanding) and existential generation (the generation of existence) tends to be resolved from within by multiple theories, but the scope difference remains with theories like Husserl and Gadamer that thematize the generation of consciousness and understanding.

Conclusion

- This survey confirmed that philosophy is a domain where structural similarity to the five-stage model is near-definitive overall
- Philosophy's greatest contribution is the multifaceted description of "En"
- Another important contribution is the critical illumination of the five-stage model
- The findings of this survey are distributed across near-definitive and probable temperature bands
